# Introduction

---

The Symphony Hardware Interface SDK is a collection of .NET interfaces that can integrate hardware systems (for example, access control systems, I/O devices, and intrusion detection systems) with the Symphony Server.

Using the Symphony Hardware Interface SDK to integrate a hardware system with the Symphony Server enables the following functionality:

- System configuration
- Device status
- Alarms
- Commands

## Getting started

1. Create a new .NET assembly DLL that includes an implementation of the [IHardwareSystem](#) and [IHardwareSystemFactory](#) interfaces in `Core.Interface.HardwareSystemFactory.dll`.
2. Put the new `Core.Interface.HardwareSystemFactory.dll` in the Symphony Server installation folder.

The Symphony Server automatically loads the DLL and the functionality is available on the Integrations page in the Symphony Server configuration interface.

## Sample

The `HardwareSystemSample` project is a sample of a hardware system integration.

The sample project consists of an implementation of the `IHardwareSystem` interface. The sample project can help you become familiar with the interface and you can use it as a template to for a new hardware system project.

# Interfaces

---

## IHardwareSystem

This interface defines the properties and methods that the Hardware System needs to implement to fully integrate with the Symphony Server.

### Namespace

Core.Interface.HardwarePack.System

### Properties

Name	Type	Description
Id	string	<ul style="list-style-type: none"> <li>The unique identifier of the system instance</li> <li>Set by the <a href="#">IHardwareSystemFactory</a> from Symphony Server</li> </ul>
Type	<a href="#">HardwareSystemType</a>	<ul style="list-style-type: none"> <li>The hardware system type</li> </ul>
Status	<a href="#">HardwareSystemStatus</a>	<ul style="list-style-type: none"> <li>The current status of the system</li> </ul>
Nodes	IEnumerable< <a href="#">HardwareNode</a> >	<ul style="list-style-type: none"> <li>Nodes tree that exists in the system</li> <li>Thread safety: best practice to synchronize access to this property between the hardware system and the Symphony Server</li> <li>Write to nodes when the status is <code>not Connected</code> and do not write to nodes when the status is <code>Connected</code></li> </ul>

### Events

Name	Type	Description
EventsReceived	<a href="#">HardwareEventReceivedHandler</a>	<ul style="list-style-type: none"> <li>Notification that an event has occurred (node and system level)</li> </ul>
StateChanged	<a href="#">HardwareStateChangedHandler</a>	<ul style="list-style-type: none"> <li>Notification that a state of a node has changed</li> </ul>
StatusChanged	<a href="#">HardwareStatusChangedHandler</a>	<ul style="list-style-type: none"> <li>Notification that the status of the system has changed</li> </ul>

## Methods

Name	Description	Parameters	Returns
Connect	<ul style="list-style-type: none"> <li>The Symphony Server calls <code>Connect</code> after creating the hardware system instance</li> </ul>	NA	NA
GetState	<ul style="list-style-type: none"> <li>Returns the state of a node</li> </ul>	string nodeId <ul style="list-style-type: none"> <li>The node ID to get the state from</li> </ul>	<a href="#">HardwareState</a> The state of the node requested
Send Command	<ul style="list-style-type: none"> <li>Sends the command</li> </ul>	string nodeId <ul style="list-style-type: none"> <li>The node to send the command to</li> </ul> string commandId <ul style="list-style-type: none"> <li>The command to send</li> </ul>	NA

## Extension methods

Name	Description	Parameters	Returns
GetAllNodes	<ul style="list-style-type: none"> <li>Returns all nodes in the system as a flat list</li> </ul>	NA	IEnumerable< <a href="#">HardwareNode</a> >
GetUniqueNodeTypes	<ul style="list-style-type: none"> <li>Returns all distinct node types available in the system</li> </ul>	NA	IEnumerable< <a href="#">HardwareNodeType</a> >

## IHardwareSystemFactory

This interface defines the properties and methods that the Hardware System Factory needs to implement to fully integrate with the Symphony Server.

### Namespace

Core.Interface.HardwarePack.System

## Properties

Name	Type	Description
Type	<a href="#">HardwareSystemType</a>	<ul style="list-style-type: none"> <li>The hardware system type that this factory creates</li> </ul>

## Methods

Name	Description	Parameters	Returns
Create	<ul style="list-style-type: none"> <li>Creates a new hardware system instance</li> </ul>	<p>string systemId</p> <ul style="list-style-type: none"> <li>The unique ID that the Symphony Server allocates to the system</li> <li>The <a href="#">IHardwareSystem.Id</a> property for the created system instance has this value</li> </ul> <p>string settingsXml</p> <ul style="list-style-type: none"> <li>An XML string that holds the configuration settings of the system</li> <li>For more information on configuration, see <a href="#">HardwareSystemConfiguration</a></li> </ul> <p><a href="#">IStatePersister</a> Data</p> <ul style="list-style-type: none"> <li>An instance of <a href="#">IStatePersister</a> that can save data to and load data from the Symphony Database</li> </ul>	NA

## IStatePersister

This interface defines the methods that a hardware system can use to persist data in the Symphony Database. The data is saved even after the system is disposed, and can be loaded when the system is initialized.

## Namespace

Core.Interface.HardwarePack.Data

## Methods

Name	Description	Parameters	Returns
Load	<ul style="list-style-type: none"> <li>Load the data that was saved in the Symphony Database</li> </ul>	NA	string
Save	<ul style="list-style-type: none"> <li>Save data in Symphony Database</li> <li>Data links to the system ID.</li> </ul>	string data <ul style="list-style-type: none"> <li>The data to be saved in the Symphony Database</li> </ul>	NA

# Classes

---

## HardwareSystemType

This class represent the data of a system type that is used for enumerating system types and defining the configuration fields. This class is a property of [IHardwareSystem](#) and [IHardwareSystemFactory](#) interfaces.

### Namespace

Core.Interface.HardwarePack.System

### Properties

Name	Type	Description
Id	string	<ul style="list-style-type: none"> <li>The identifier of the hardware system type</li> </ul>
Name	string	<ul style="list-style-type: none"> <li>The name of the hardware system type</li> <li>This name appears on the Integrations page in the Symphony Server configuration interface</li> </ul>
Configuration	<a href="#">HardwareSystemConfiguration</a>	<ul style="list-style-type: none"> <li>The configuration details used to generate user interfaces for editing the settings XML</li> <li>Set to null to use a basic text box to edit settings XML</li> </ul>

## HardwareSystemConfiguration

This class defines the configuration details used to generate the user interfaces for editing the settings XML of a hardware system.

### Namespace

Core.Interface.HardwarePack.System

### Properties

Name	Type	Description
TemplateXml	string	<ul style="list-style-type: none"> <li>A settings XML with no values or with default values</li> </ul>

Name	Type	Description
Fields	<code>HardwareSystemConfigurationField[]</code>	<ul style="list-style-type: none"> <li>The definitions of the fields that are included in the configuration</li> </ul>
Details	<code>string[]</code>	<ul style="list-style-type: none"> <li>An array of field IDs that are concatenated to generate summary details</li> </ul>

## HardwareSystemConfigurationField

This class defines the configuration fields used in [HardwareSystemConfiguration](#).

### Namespace

`Core.Interface.HardwarePack.System`

### Properties

Name	Type	Description
Id	<code>string</code>	<ul style="list-style-type: none"> <li>The identifier for the field</li> </ul>
Selector	<code>string</code>	<ul style="list-style-type: none"> <li>The selector to determine the location of field's XML element in the settingsXml</li> <li>See <a href="https://api.jquery.com/category/selectors/">https://api.jquery.com/category/selectors/</a></li> </ul>
Type	<code>string</code>	<ul style="list-style-type: none"> <li>The field data type</li> <li>All optional data types are const members of this class</li> <li>Includes:                             <ul style="list-style-type: none"> <li>TypeString</li> <li>TypeNumber</li> <li>TypeBoolean</li> <li>TypePassword</li> <li>TypeIPAddress</li> </ul> </li> </ul>
DefaultValue	<code>string</code>	<ul style="list-style-type: none"> <li>The field default value</li> </ul>
MinimumNumber	<code>int</code>	<ul style="list-style-type: none"> <li>The minimum number using TypeNumber</li> <li>Null if not used</li> </ul>
MaximumNumber	<code>int</code>	<ul style="list-style-type: none"> <li>The maximum number using TypeNumber</li> <li>Null if not used</li> </ul>

Name	Type	Description
Label	string	<ul style="list-style-type: none"> <li>The displayed label of the field</li> </ul>
Row	int	<ul style="list-style-type: none"> <li>The field's row in the configuration UI</li> </ul>
Column	int	<ul style="list-style-type: none"> <li>The field's column in the configuration UI</li> </ul>
IsRequired	bool	<ul style="list-style-type: none"> <li>Is the field required</li> </ul>

## HardwareNode

This class represents a hardware node in the system. A hardware node can represent a device, controller, input/output point, sensor, etc. The hardware node can have events triggered on, report its status, and send commands.

### Namespace

Core.Interface.HardwarePack.Node

### Properties

Name	Type	Description
Id	string	<ul style="list-style-type: none"> <li>The unique identifier of the node</li> <li>Used in all node related operations (for example, send command, trigger event)</li> </ul>
Name	string	<ul style="list-style-type: none"> <li>The display name of the node</li> </ul>
Type	<a href="#">HardwareNodeType</a>	<ul style="list-style-type: none"> <li>The type of the node</li> <li>Defines the events/ commands/states it supports</li> </ul>
Parent	HardwareNode	<ul style="list-style-type: none"> <li>The parent node in the nodes tree</li> </ul>
Children	List<HardwareNode>	<ul style="list-style-type: none"> <li>The list of child nodes in the nodes tree</li> </ul>

Name	Type	Description
LocationRangeDescription	<a href="#">LRangeDescription</a>	<ul style="list-style-type: none"> <li>The location description of the node</li> <li>Only for nodes that can support location based events</li> <li>Null if not used</li> </ul>
System	<a href="#">IHardwareSystem</a>	<ul style="list-style-type: none"> <li>The system that the node is part of</li> </ul>

## Methods

Name	Description	Parameters	Returns
AddChild	<ul style="list-style-type: none"> <li>Adds a child node</li> <li>Updates <code>Parent</code> property of the child and <code>Children</code> property of the current node</li> </ul>	HardwareNode child	none

## HardwareNodeType

This class represents a Hardware Node type. It defines the states/events/commands that the nodes from this type supports.

## Namespace

Core.Interface.HardwarePack.Node

## Properties

Name	Type	Description
Id	string	<ul style="list-style-type: none"> <li>The unique identifier of the Node Type</li> </ul>
Name	string	<ul style="list-style-type: none"> <li>The display name of the type</li> </ul>
AvailableEventTypes	List< <a href="#">HardwareEventType</a> >	<ul style="list-style-type: none"> <li>A list of the events that the node type supports</li> </ul>
AvailableCommands	List< <a href="#">HardwareCommand</a> >	<ul style="list-style-type: none"> <li>A list of the commands that the node type supports</li> </ul>
AvailableStates	List< <a href="#">HardwareState</a> >	<ul style="list-style-type: none"> <li>A list of the states that the node type supports</li> </ul>

Name	Type	Description
AccessGrantedEventTypes	List<HardwareEventType>	<ul style="list-style-type: none"> <li>• Only for Access Control type of nodes</li> <li>• A list of the events that the node type supports that represent Access Granted events</li> <li>• Null if not used</li> </ul>
AccessDeniedEventTypes	List<HardwareEventType>	<ul style="list-style-type: none"> <li>• Only for Access Control type of nodes</li> <li>• A list of the events that the node type supports that represent Access Denied events</li> <li>• Null if not used</li> </ul>

## LRangeDescription

This class defines properties and methods that the hardware system needs to implement to fully integrate with the Symphony Server.

### Namespace

Core.Interface.HardwarePack.Node

### Properties

Name	Type	Description
Start	uint	<ul style="list-style-type: none"> <li>• The start of the range</li> </ul>
End	uint	<ul style="list-style-type: none"> <li>• The end of the range</li> </ul>

## HardwareCommand

This class represents the hardware command data.

### Namespace

Core.Interface.HardwarePack.Data

## Properties

Name	Type	Description
Id	string	<ul style="list-style-type: none"> <li>The unique identifier of the command</li> <li>Used when sending commands)</li> </ul>
Name	string	<ul style="list-style-type: none"> <li>The display name of the command</li> </ul>
RequiredStates	IEnumerable< <a href="#">HardwareState</a> >	<ul style="list-style-type: none"> <li>If this collection is not empty, the command is only available when node state is one of these states.</li> <li>If this collection is empty, the command is always available regardless of node state.</li> </ul>

## HardwareEventType

This class represents the hardware event type data.

### Namespace

Core.Interface.HardwarePack.Data

### Properties

Name	Type	Description
Id	string	<ul style="list-style-type: none"> <li>A unique Identifier of the event</li> </ul>
Name	string	<ul style="list-style-type: none"> <li>The display name of the event</li> </ul>
Category	<a href="#">HardwareEventTypeCategory</a>	<ul style="list-style-type: none"> <li>The category of the event</li> </ul>

## HardwareState

This class represents the hardware state data.

### Namespace

Core.Interface.HardwarePack.Data

### Properties

Name	Type	Description
Id	string	<ul style="list-style-type: none"> <li>A unique Identifier of the state</li> </ul>

Name	Type	Description
Name	string	<ul style="list-style-type: none"> <li>The display name of the state</li> </ul>
Type	HardwareStateType	<ul style="list-style-type: none"> <li>The type of the state</li> </ul>
AlarmLocationDetails	IEnumerable<LocationDetails>	<ul style="list-style-type: none"> <li>A collection of locations details where there are alarms (recent non active, or currently active)</li> </ul>

## LocationDetails

This class represents a location where there is currently an alarm (recently inactive or currently active).

### Namespace

Core.Interface.HardwarePack.Data

### Properties

Name	Type	
DistancFromStartPoint	float?	<ul style="list-style-type: none"> <li>Distance from the start of the range</li> <li>Null if not available</li> </ul>
Latitude	float?	<ul style="list-style-type: none"> <li>Absolute latitudinal position</li> <li>Null if not available</li> </ul>
Longitude	float?	<ul style="list-style-type: none"> <li>Absolute longitudinal position</li> <li>Null if not available</li> </ul>
Altitude	float?	<ul style="list-style-type: none"> <li>Absolute altitude</li> <li>Null if not available</li> </ul>
IsActive	bool	<ul style="list-style-type: none"> <li>Is the alarm currently active</li> </ul>

## HardwareEventArgs

This class defines the arguments that are sent on a hardware system event when triggered.

### Namespace

Core.Interface.HardwarePack.Event

## Properties

Name	Type	Description
NodeId	string	<ul style="list-style-type: none"> <li>Node identifier the event is triggered on</li> </ul>
NodeName	string	<ul style="list-style-type: none"> <li>Node name the event is triggered on</li> </ul>
UserId	long	<ul style="list-style-type: none"> <li>The id of the user that triggered the event</li> <li>Null if not used</li> </ul>
UserDescription	string	<ul style="list-style-type: none"> <li>The description of the user that triggered the event</li> <li>Null if not used</li> </ul>
UserName	string	<ul style="list-style-type: none"> <li>The name of the user image that triggered the event</li> <li>Null if not used</li> </ul>
UserImageData	byte[]	<ul style="list-style-type: none"> <li>The user image that triggered the event</li> <li>Null if not used</li> </ul>
Location	<a href="#">LocationDetails</a>	<ul style="list-style-type: none"> <li>The location of the event</li> <li>Null if not used</li> </ul>
SystemId	string	<ul style="list-style-type: none"> <li>The system identifier the event is triggered from</li> </ul>
UtcTime	DateTime	<ul style="list-style-type: none"> <li>The time (in UTC) when the event occurs</li> </ul>

## HardwareStateEventArgs

This class defines the arguments that are sent on a hardware system state change when a node state changes.

### Namespace

Core.Interface.HardwarePack.Event

### Properties

Name	Type	Description
NodeId	string	<ul style="list-style-type: none"> <li>The identifier of the node for which the state changes</li> </ul>
NodeName	string	<ul style="list-style-type: none"> <li>The name of the node for which the state changes</li> </ul>

Name	Type	Description
State	<a href="#">HardwareState</a>	<ul style="list-style-type: none"> <li>The new state of the node</li> </ul>
SystemId	string	<ul style="list-style-type: none"> <li>The identifier of the hardware system to which the node is a part</li> </ul>
UtcTime	datetime	<ul style="list-style-type: none"> <li>The time (in UTC) when the state changes</li> </ul>

## HardwareStatusEventArgs

This class defines the arguments that are sent when the status of the hardware system changes.

### Namespace

Core.Interface.HardwarePack.Event

### Properties

Name	Type	Description
Status	<a href="#">HardwareSystemStatus</a>	<ul style="list-style-type: none"> <li>The new status of the hardware system</li> </ul>
SystemId	string	<ul style="list-style-type: none"> <li>The hardware system identifier</li> </ul>
UtcTime	datetime	<ul style="list-style-type: none"> <li>The time (in UTC) when the status changes</li> </ul>

# Enumerations

---

## HardwareSystemStatus

This enumeration defines the possible statuses of the hardware system.

### Namespace

Core.Interface.HardwarePack.System

### Values

Name	Description
Error	<ul style="list-style-type: none"><li>The hardware system is in an unrecoverable error state</li><li>The Symphony Server disposes and recreates the system</li></ul>
Initialized	<ul style="list-style-type: none"><li>The hardware system is initialized and waiting for a connection request</li></ul>
Connecting	<ul style="list-style-type: none"><li>The hardware system is in the process of connecting</li></ul>
Connected	<ul style="list-style-type: none"><li>The hardware system is connected</li></ul>

## HardwareStateType

This enumeration defines the possible state types of the hardware node.

### Namespace

Core.Interface.HardwarePack.Data

### Values

Name	Description
Normal	<ul style="list-style-type: none"><li>The state is the normal state</li></ul>
Warning	<ul style="list-style-type: none"><li>The state is a warning state</li></ul>
Alert	<ul style="list-style-type: none"><li>The state is an alert state</li></ul>

## HardwareEventTypeCategory

This enumeration defines properties and methods that a hardware system needs to implement to fully integrate with the Symphony Server.

## Namespace

Core.Interface.HardwarePack.Data

## Values

Name	Description
Default	<ul style="list-style-type: none"><li>• The default category</li></ul>
PIDS	<ul style="list-style-type: none"><li>• The PIDS intrusion detection system category</li></ul>
AccessGranted	<ul style="list-style-type: none"><li>• The access granted category</li><li>• Used for access control systems</li></ul>
AccessDenied	<ul style="list-style-type: none"><li>• The access denied category</li><li>• Used for access control systems</li></ul>

# Delegates

---

## HardwareEventReceivedHandler

This delegate represents the method that handles an event received from a hardware system.

### Namespace

Core.Interface.HardwarePack.Event

### Parameters

Name	Type	Description
e	HardwareEventArgs	<ul style="list-style-type: none"> <li>An object that contains the arguments of the event</li> </ul>

## HardwareStateChangedHandler

This delegate represents the method that handles a node state change event received from a hardware system.

### Namespace

Core.Interface.HardwarePack.Event

### Parameters

Name	Type	Description
e	HardwareStateEventArgs	<ul style="list-style-type: none"> <li>An object that contains the arguments of the node state change event</li> </ul>

## HardwareStatusChangedHandler

This delegate represents the method that handles a system status event received from a hardware system.

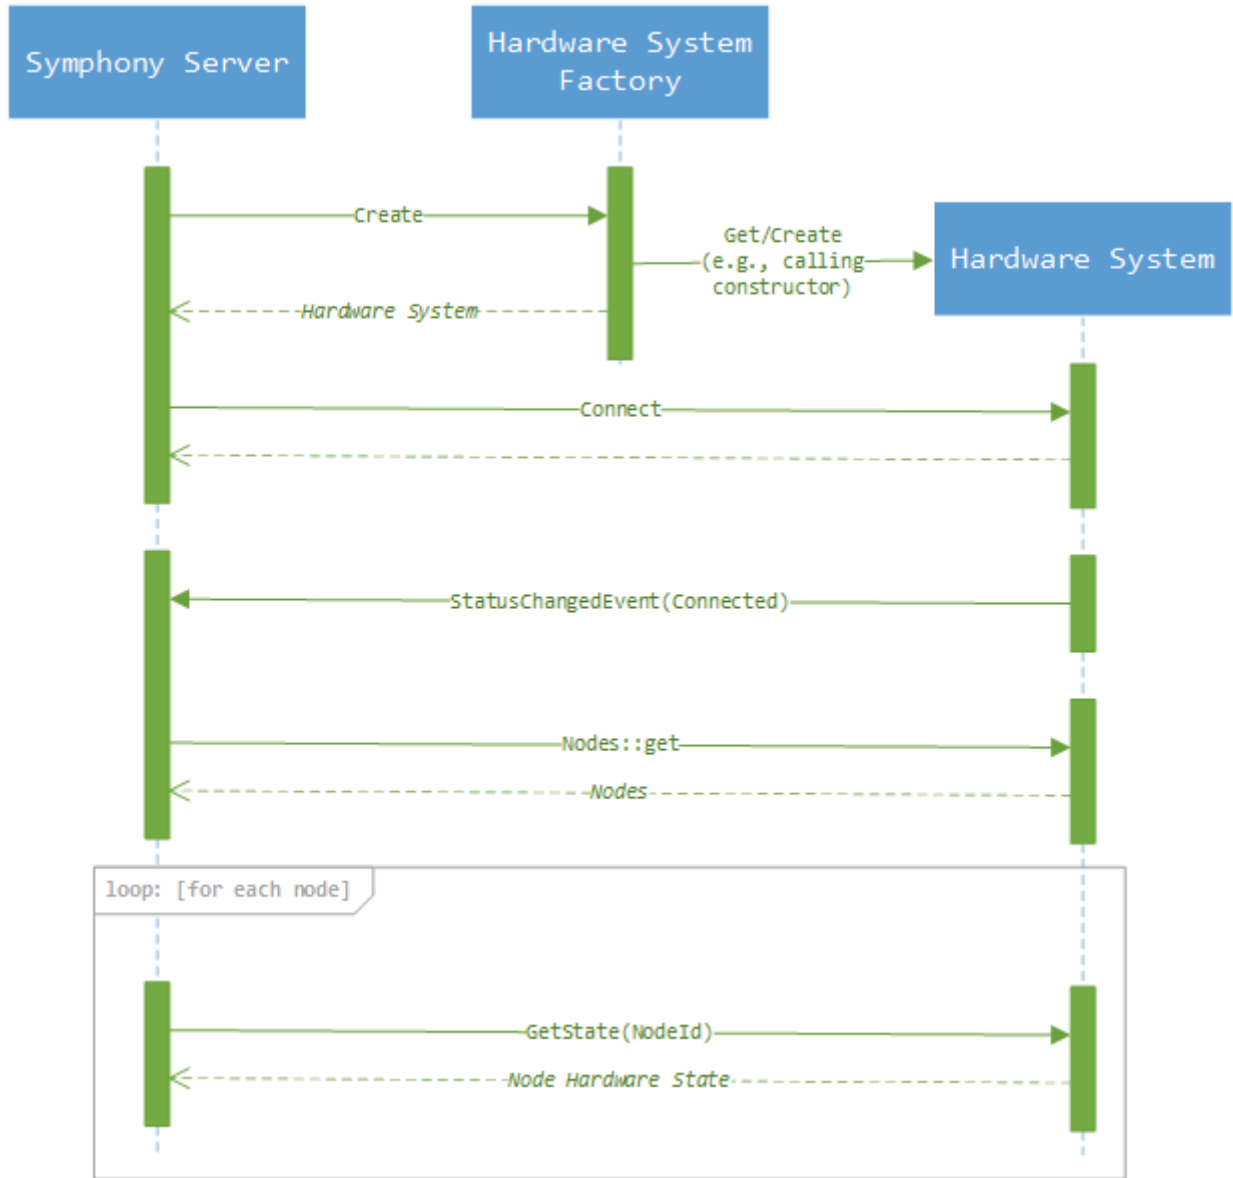

### Namespace

Core.Interface.HardwarePack.Event

### Parameters

Name	Type	Description
e	HardwareStatusEventArgs	<ul style="list-style-type: none"> <li>An object that contains the arguments of the system status event</li> </ul>

# Basic system initialization flow
